Benefits and Risks of Sterilization: ACOG Practice Bulletin 208, March 2019

- 220 million couples worldwide
- U.S. annually: 600,000 tubal occlusions
- 200,000 Vasectomies

Case Presentation

36 year old female G5P3013 presents at 18 weeks gestation, she is in her second monogamous relationship. She has used birth control pills and condoms for contraception. Now she is considering permanent sterilization.

What are her options?

Long Acting Reversible Contraceptives (LARC)

Intrauterine Devices

HORMONAL Levonorgestrel

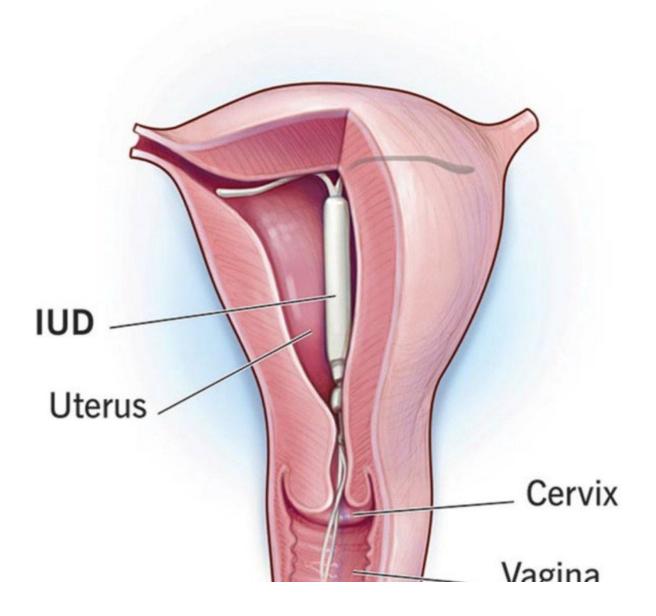

Mirena - used for 8 years Kyleena - used for 5 years Liletta - used for 8 years Skyla - used for 3 years

NON-HORMONAL

Paragard - used for 10 years. Copper

<u>IMPLANT</u>

Nexplanon - used for 3 years - Etonogestrel implant

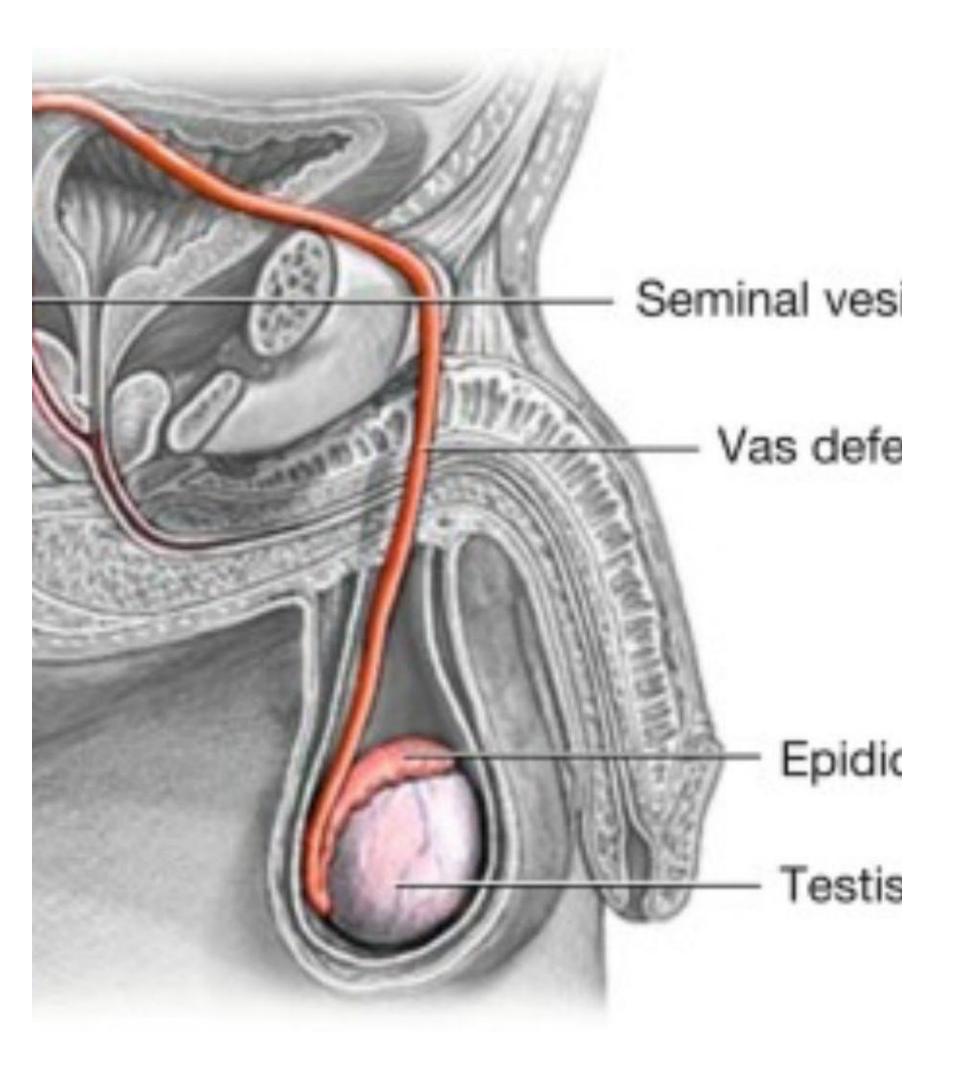

Vasectomies

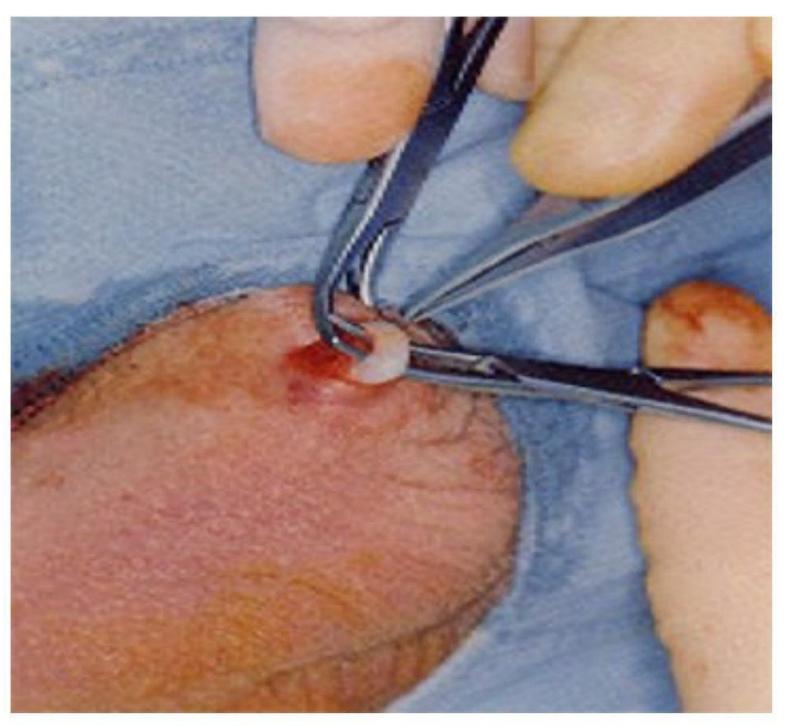

- Outpatient procedure
- Local anesthesia
- Not immediately effective: an alternative form of contraception must be used.
- Most men are azoospermic at 3 months on sperm analysis
- 98-99% are azoospermic at 6 months

Are Vasecomies Reversable?

• Yes, they can be reversable. The vas deferens can be reunited.

Isolating the vas during vasectomy

A loop of vas deferens is brought up through the wound, divided, and a segment removed.

Questions about Vasectomies?

What forms of female sterilization are available?

Timing for Bilateral Tubal Ligation (BTL)

POSTPARTUM

Immediately after postpartum or 6 weeks after delivery

INTERVAL

If not pregnant it can be done 30 days after signing the PM 330 form (consent form)

CONSENT FORM PM 330

NOTICE: YOUR DECISION AT ANY TIME NOT TO BE STERILIZED WILL NOT RESULT IN THE WITHDRAWAL OR WITHHOLDING OF ANY BENEFITS PROVIDED BY PROGRAMS OR PROJECTS RECEIVING FEDERAL FUNDS.

■ CONSENT TO STERILIZATION ■ I have asked for and received information about sterilization from Eisner Pediatric and Family Medical Center-Lynwood . When I first asked for the information, I was told that the decision to be sterilized is completely up to me. I was told that I could decide not to be sterilized. If I decide not to be sterilized, my decision will not affect my right to future care or treatment. I will not lose any help or benefits from programs receiving Federal funds, such as A.F.D.C. or Medicaid that I am now getting or for which I may become eligible. I UNDERSTAND THAT THE STERILIZATION MUST BE CONSIDERED PERMANENT AND NOT REVERSIBLE. I HAVE DECIDED THAT I DO NOT WANT TO BECOME PREGNANT, BEAR CHILDREN OR FATHER CHILDREN. I was told about those temporary methods of birth control that are available and could be provided to me which will allow me to bear or father a child in the future. I have rejected these alternatives and chosen to be sterilized. I understand that I will be sterilized by an operation known as a The discomforts, risks and benefits associated with the operation have been explained to me. All of my questions have been answered to my satisfaction. I understand that the operation will not be done until at least thirty days after I sign this form. I understand that I can change my mind at any time and that my decision at any time not to be sterilized will not result in the withholding of any benefits or medical services provided by federally funded programs. I am at least 21 years of age and was born on ____ Mo Day hereby consent of my own free will to be sterilized by method called_____ My consent expires 180 days from the date of my signature below. I also consent to the release of this form and other medical records about the Representatives of the Department of Health and Human Services. Employees of programs or projects funded by that Department but only for determining if Federal laws were observed. I have received a copy of this form. Mo Day Yr Signature of individual to be sterilized ■ INTERPRETER'S STATEMENT ■ If an interpreter is provided to assist the individual to be sterilized: I have translated the information and advice presented orally to the individual to be sterilized by the person obtaining this consent. I have also read him/her the consent explained its contents to him/her. To the best of my knowledge and belief he/she

understood this explanation.

Signature of Interpreter

Regrets/Considerations

- Young age, common in women less than age 30
- Lack of information of alternative methods
- Making a decision under pressure
- Unstable relationship
- Low parity

Logistics to Consider

State Laws: California requires age 21 for sterilization. Some states have limits to consent for sterilization when seeking an abortion.

PM 330 Form: Needs to have been signed for at least 30 days, the consent is valid up to 6 months.

Ethical considerations:

- Disabled
- Mentally challenged individuals Increase risk of an ectopic pregnancy
- Does not prevent HIV or other sexually transmitted diseases

Are Tubal Ligations Reversable?

 Depends on the type of procedure and how much healthy tube is left.

General Surgical Risk for Tubal Ligations

- Blood loss
- Organ damage: bowel, bladder, and major vessel injuries
- Reaction to anesthesia
- Infection
- Luteal phase pregnancy
- Increase risks of an ectopic pregnancy

No clear association with

- Menstrual symptoms
- Dysmenorrhea
- Heavy uterine bleeding
- Impaired sexual function
- Ovarian reserve

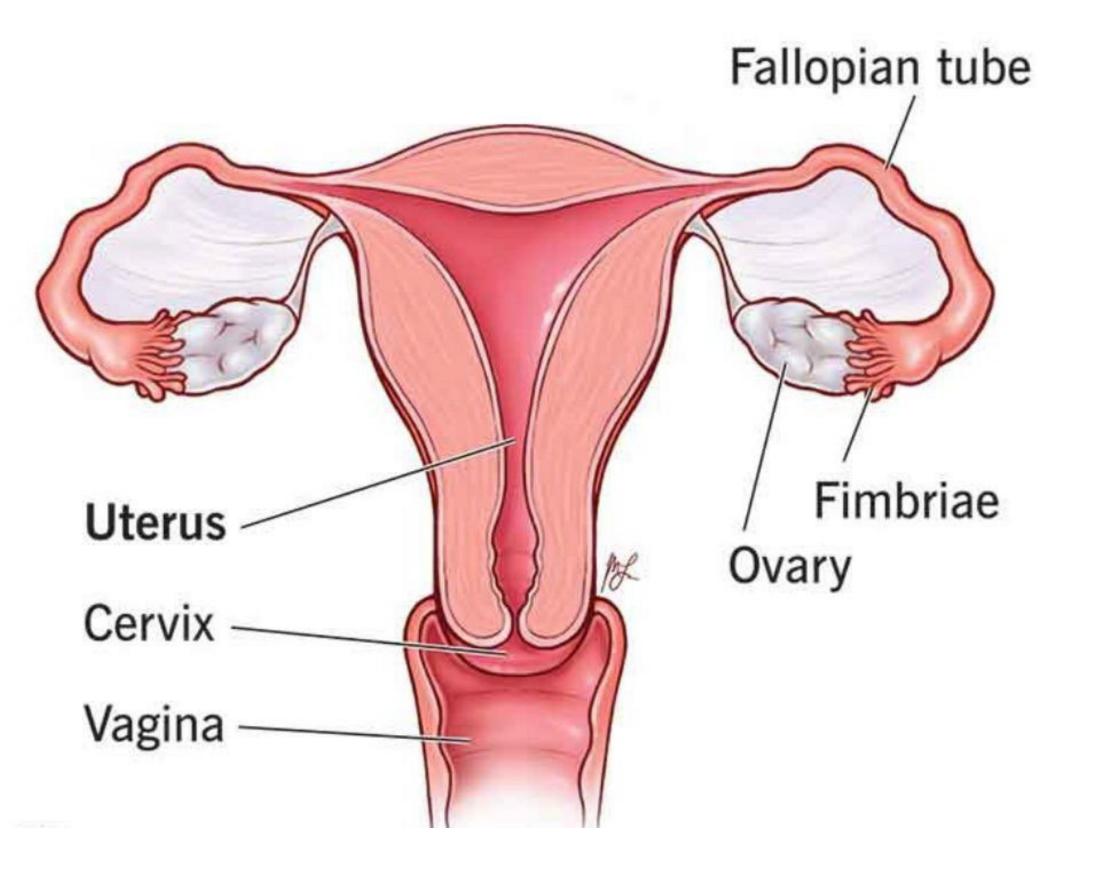

Surgical Techniques

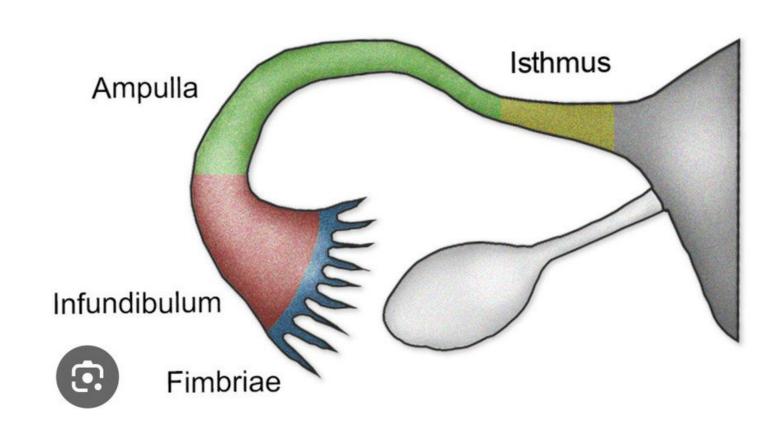

- 1. Electrocoagulation
- 2. Mechanical Devices
- 3. Partial / Complete Tubal Excision

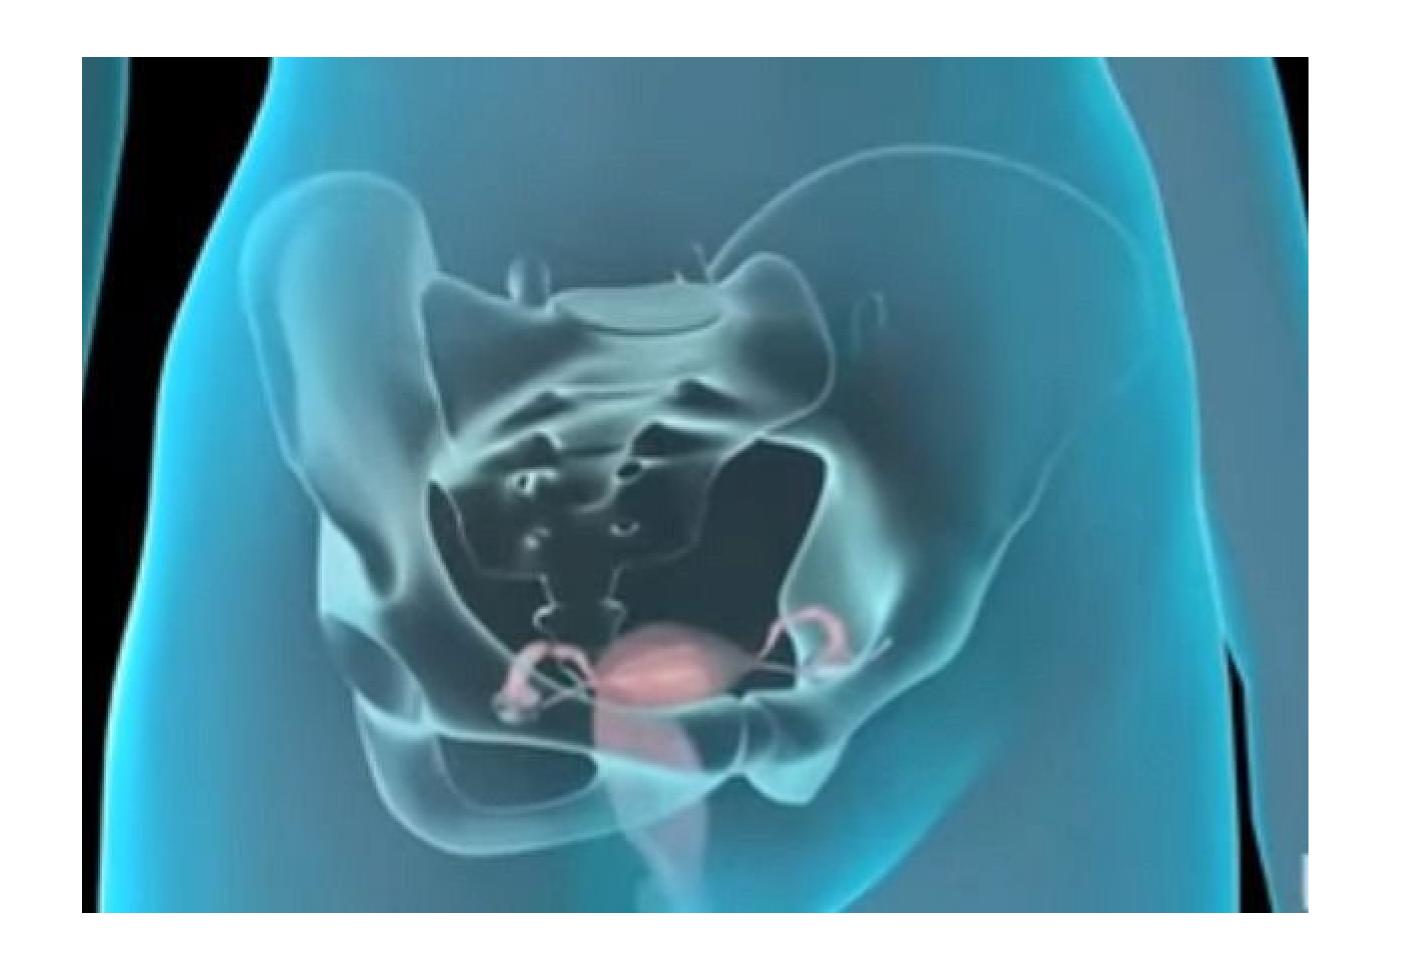

Postpartum

• Minilaparotomy: Small infraumbilical incision made and the tubes are exposed. Partial or complete removal of the fallopian tube.

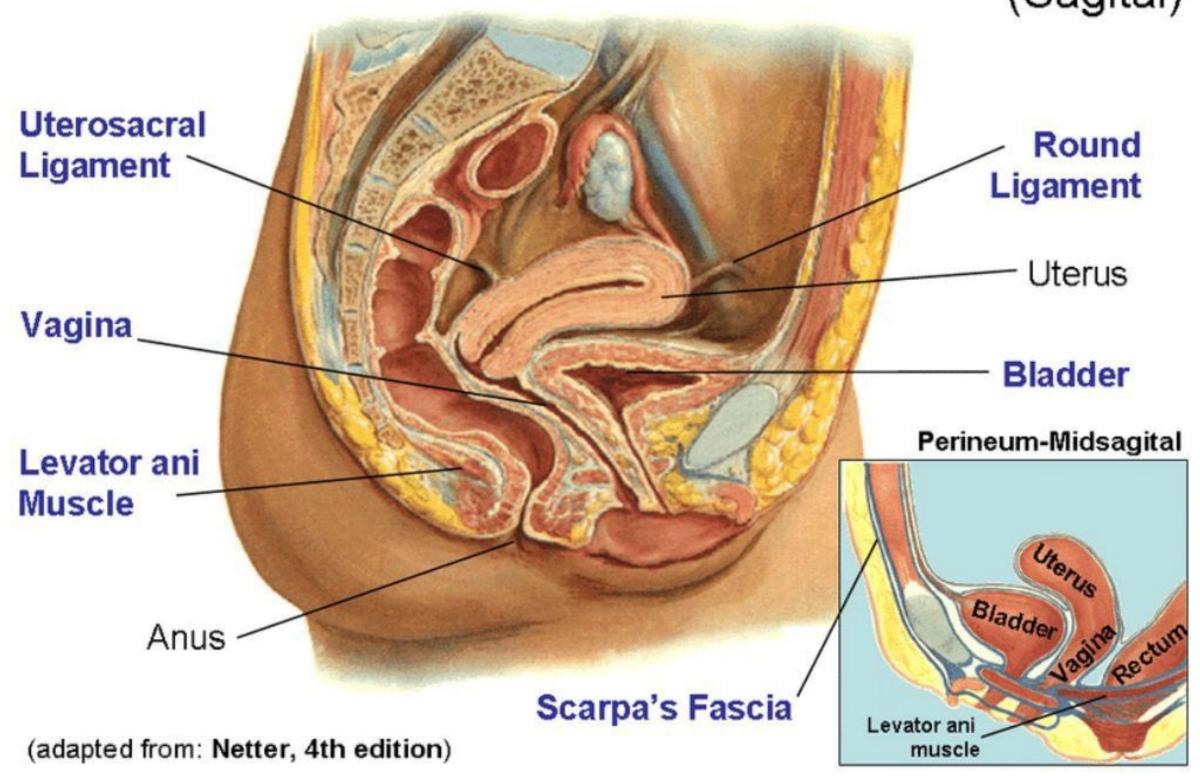

Uterus

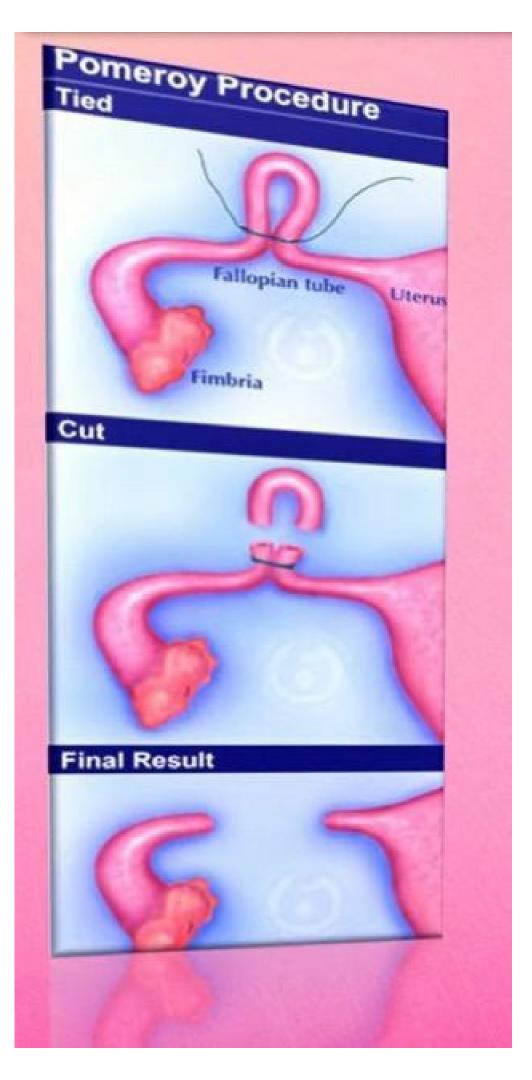

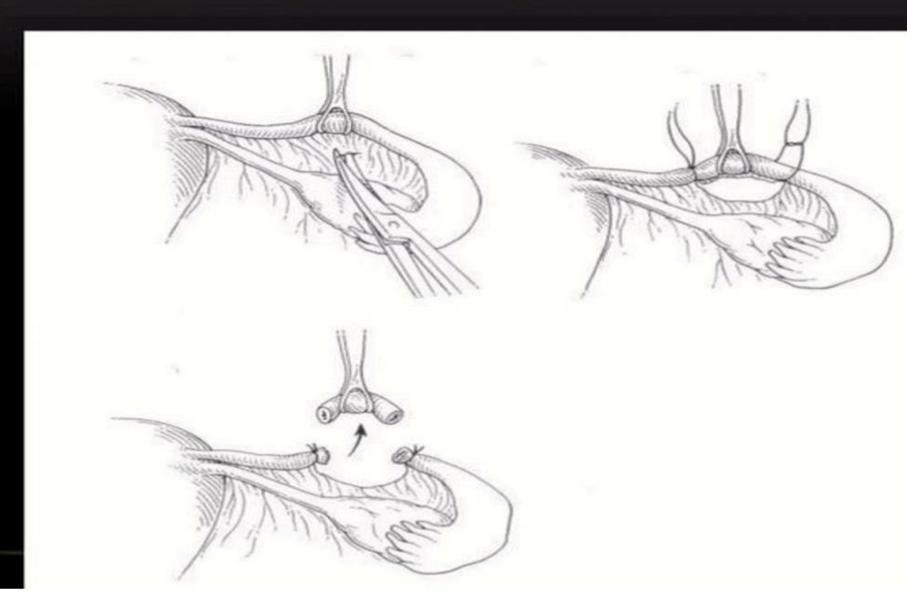

Pelvic Viscera and Perinium: Female - Median section (Sagital)

PARKLAND PROCEDURE

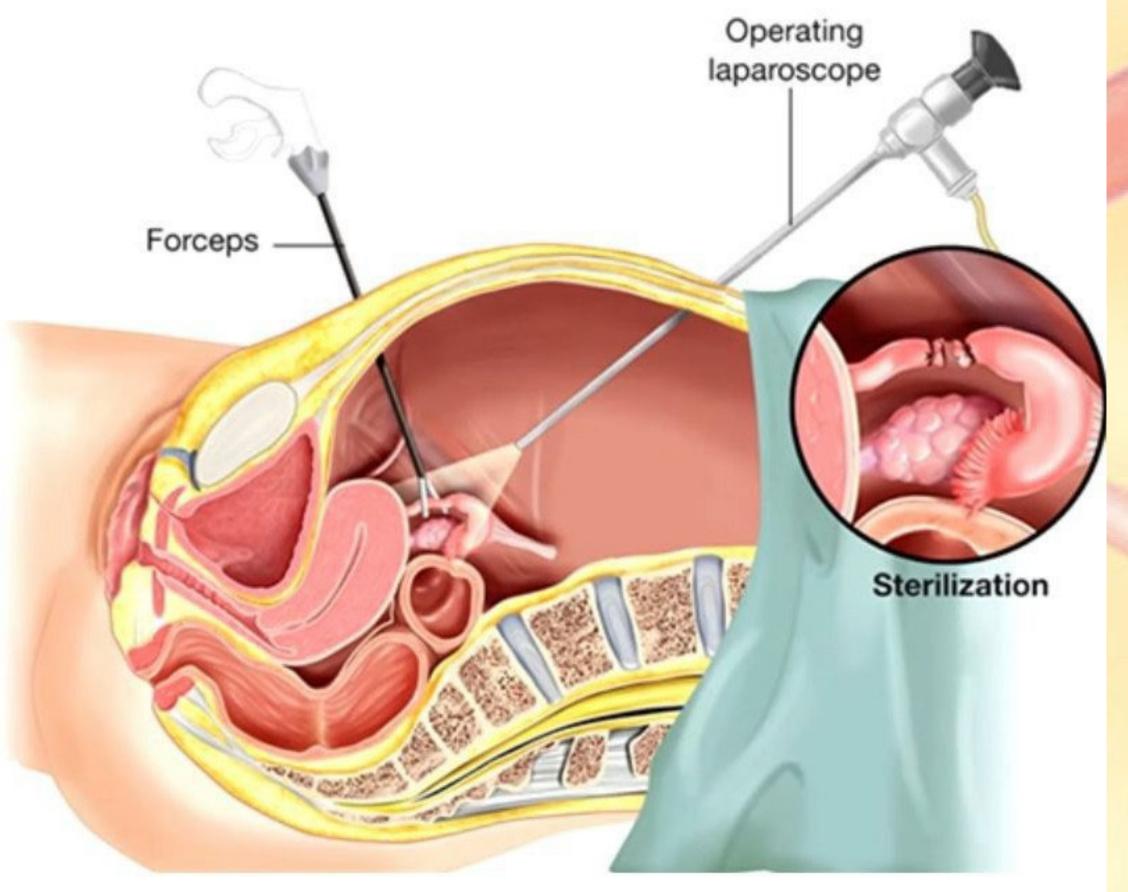

The Parkland
method
provides for
immediate
anatomic
separation of
the
disconnected
tubal segments
unlike the
Pomeroy
technique.

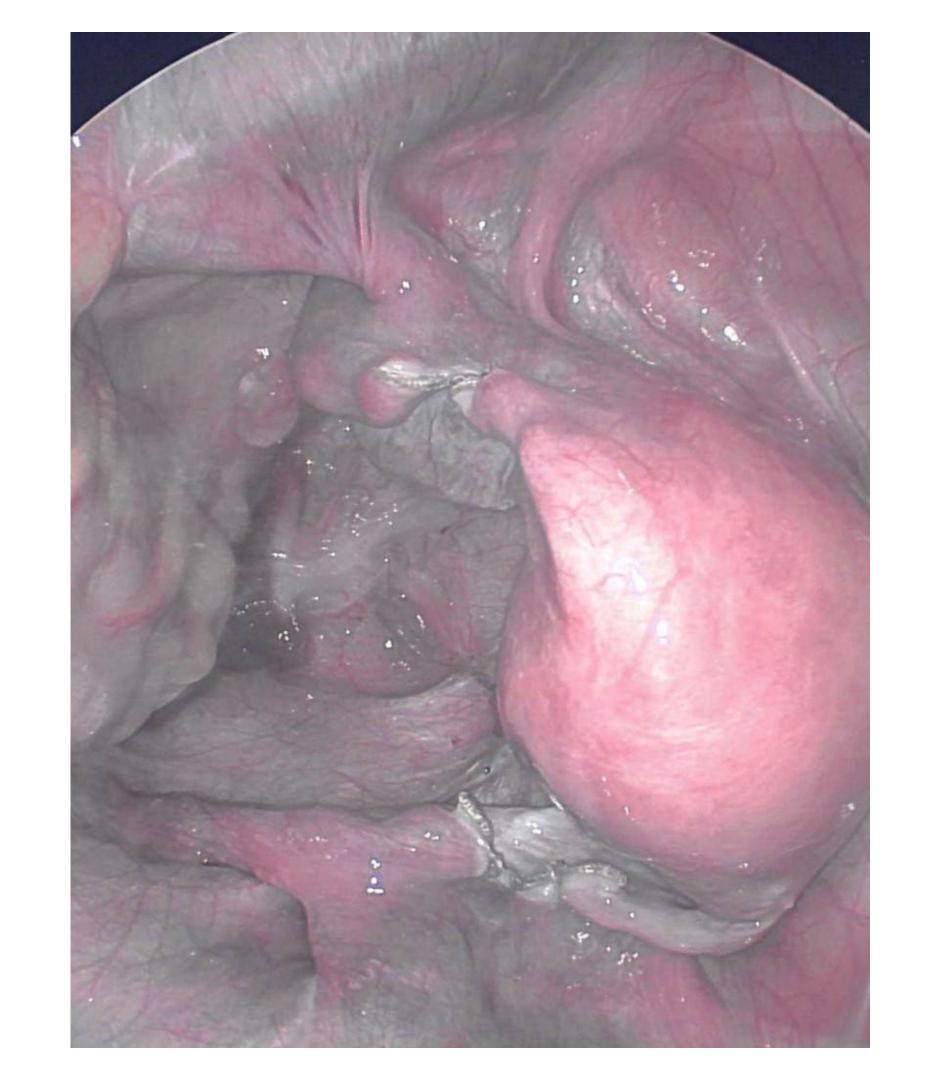

Minimally Invasive Sterilization

- Laparoscopic
- Outpatient
- Overall well tolerated and good recovery
- Risk: injury to pelvic or abdominal organs, infection, anesthesia reaction
- Post ablation tubal sterilization syndrome
- Laparoscopic major complications 0.1-3.5%, rate 0.9-1.6 per 100 cases. Conversation to laparotomy 0.9 per 100 cases.

Laparoscopic Sterilisation

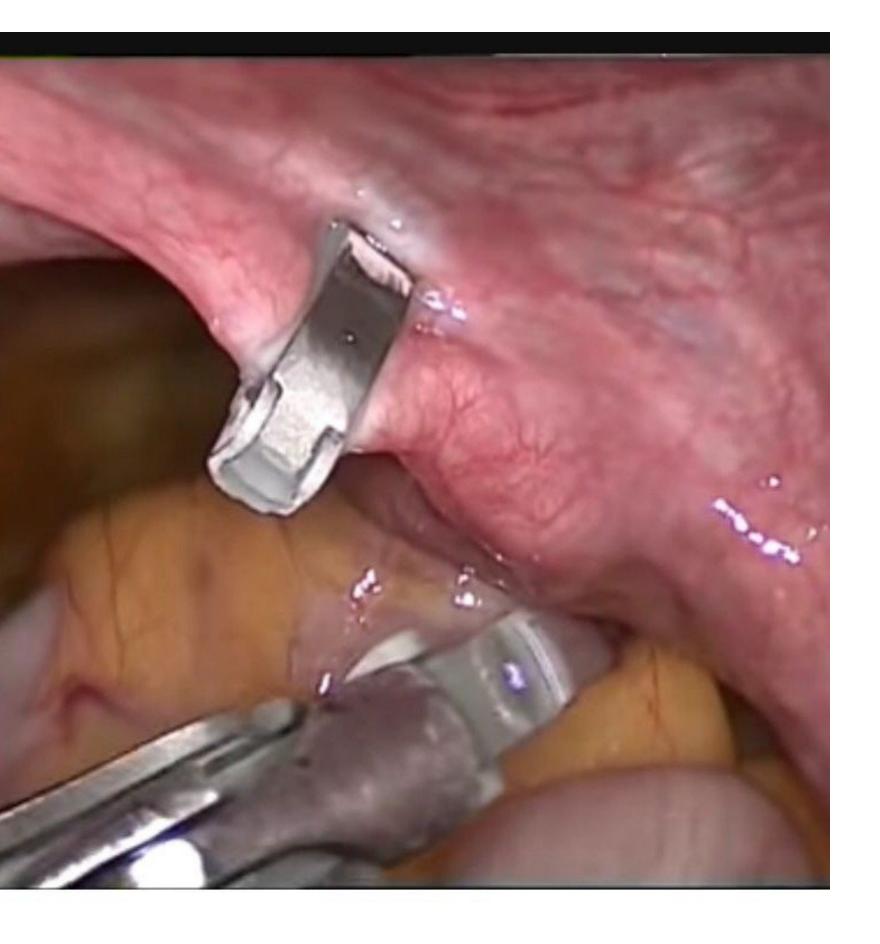

Mechanical Devices

- Silicon rubber band
- Spring-loaded clip
- Titanium clip lined with silicon rubber

Risk of miss application and increased failure rate is associated with tubal adhesions, thicken tubes or dilated fallopian tubes.

opic Tubal Ligation with Filshie

Questions about the surgical procedures?

New Trend: Bilateral Salpingectomy

- Removal of the entire fallopian tubes
- Done as a way to also reduce ovarian cancer
- Ovarian cancer may originate from the fimbriae of the fallopian tube

Failure Rate

	1 to 2 years	3 to 5 years	7 to 12 years				
Female permanent contraception							
Postpartum permanent contraception							
Postpartum partial salpingectomy	1.2 (1)	6.3 (5)	7.5 (10)				
Postpartum titanium clips (Filshie clips)	17 (2)		<u>~</u>				
Interval permanent contraception							
Interval partial salpingectomy	7.3 (1)	15.1 (5)	20.1 (10)				
Interval titanium clips (Filshie clips)	4 (2)	-	-				
Silicone rubber band (Falope Ring)	3 (1 to 2)	10 (5)	17.7 (10)				
Electrosurgery	<u>=</u>	3.2* (5)	<u>=</u>				
Male permanent contraception							
Vasectomy 1.5 (2)		_	-				
LARC							
LNG IUD 52/8 (Mirena¶/Liletta∆)	2 (1)	7 (5)	14 (8)				
LNG IUD 19.5/5 (Kyleena) [§]	2 (1)	15 (5)	_				
LNG IUD 13.5/3 (Skyla)¥	4 (1)	9 (3)	=				
TCu380A copper IUD (Paragard)	8 (1)	-	14 (7); 22 (12)				
Etonogestrel implant (Nexplanon)	0.5 (1)	4 (3); 6 (5)	-				

IUD: intrauterine device; LARC: long-acting reversible contraception; LNG: levonorgestrel.

¶ LNG-releasing IUD containing 52 mg LNG at initial placement and with an initial LNG release rate of 20 mcg/day for 8 years (Mirena).

Δ LNG-releasing IUD containing 52 mg LNG at initial placement and with an initial LNG release rate of 18.6 mcg/day for 8 years (Liletta).

A 5-year data is 7/1000 for Mirena and 8/1000 for Liletta: this is not statistically different

^{*} With three contiguous sites of fulguration along the fallopian tube (a total length of fulguration of approximately 3 cm).

Failure Rate

Table 1. Pregnancy Rates by Sterilization Method

Method	5-year (per 1,000 procedures)	10-year (per 1,000 procedures)	Ectopic (per 1,000 procedures)
Postpartum partial salpingectomy	6.3	7.5	1.5
Bipolar coagulation*†	16.5	24.8	17.1
Silicone band methods	10.0	17.7	7.3
Spring clip	31.7	36.5	8.5
Vasectomy	11.3		No association

^{*}Secondary analysis of 5-year failure rates with bipolar coagulation performed in different decades found that failure was significantly lower in later periods, reflecting improved technique with the method: 19.5 per 1,000 procedures for 1978–1982 versus 6.3 per 1,000 procedures for 1985–1987.

Data from Jamieson DJ, Costello C, Trussell J, Hillis SD, Marchbanks PA, Peterson HB. The risk of pregnancy after vasectomy.
